

Fusion 360 Assignment: 1 Litre Water Bottle Model

Tools Used

To create this **1 litre water bottle** in Fusion 360, I used the following tools:

1. Sketch Tool

- Created 2D sketches using circles and lines on the origin plane.
- The sketch defined the profile and dimensions of the bottle to match **1 litre capacity**.

2. Revolve Tool

- Used to create the main bottle body by revolving the half-profile sketch around the central axis.
- This ensured a symmetric and accurate bottle shape.

3. Extrude Tool

- Used to create the bottle neck and cap.

- Helped in adding height and thickness to required parts.

4. Shell Tool

- Applied to hollow the solid bottle.
- Maintained uniform wall thickness suitable for a **1 litre water bottle**.

5. Fillet Tool

- Added fillets to sharp edges for smoothness and safety.
- Improved the overall appearance of the bottle.

6. Thread Tool

- Used on the neck to create screw threads.
- Made the bottle suitable for a screw-type cap.

7. Appearance Tool

- Applied transparent material to represent a plastic water bottle.

Outcome of the Design

- The final model is a **1 litre water bottle** designed in Fusion 360.
- The bottle has a realistic shape, smooth curves, and proper wall thickness.
- Threaded neck allows secure closing with a cap.
- The transparent appearance gives a professional and realistic look.
- Through this assignment, I gained hands-on experience in **sketching, revolving, shelling, and threading operations**.
