Mobile Thermometer Sensor Detection App

Description:

This application is developed using **MIT App Inventor** to check whether a mobile phone has a **thermometer (temperature) sensor** and to display the temperature value if the sensor is available.

The app contains three main buttons: **Check**, **Enable**, and **Disable**.

When the user clicks the **Check** button, the app verifies the availability of the thermometer sensor in the mobile device. If the sensor is available, a notification message is displayed saying *"Your mobile has a thermometer sensor"*. If not, it shows *"Your mobile does not have a thermometer sensor"*.

The **Enable** button activates the thermometer sensor and displays the current temperature value on the screen using a label. The temperature value updates automatically whenever the sensor reading changes.

The **Disable** button is used to turn off the thermometer sensor when it is not needed.
